

## Navigation CSS Migration Plan

### 0. Design target

New structural classes:

- sidebar-nav – container for all navigation sections
- sidebar-nav-item – any clickable row
- sidebar-nav-subitem – nested rows

### 1. Inventory & isolate existing sidebar styles

Collect all rules in app.css and sidebar.css relating to navigation.  
Mark navigation-only vs field-browser/pill usage.

### 2. Introduce new nav classes

Add to sidebar.css:

```
.sidebar-nav { ... }  
.sidebar-nav-item { ... }  
.sidebar-nav-subitem { ... }
```

### 3. Update JSX to use new classes

Before:

SOURCE

After:

SOURCE

### 4. Remove old indentation rules

Delete or narrow .nested-list padding-left.

Ensure FIELDS/DATA subsections no longer use nested-list.

### 5. Ensure field-browser and pills do not use nav classes

Verify they only use field-browser.css and field-pill classes.

### 6. Clean up legacy selectors in app.css

Delete nav styling there and move relevant rules into sidebar.css.

This plan ensures:

- Single class for top-level nav rows
- Single class for nested nav rows
- No cross-contamination with field browser or pills
